THIS IS SECURITY AUDIT REPORT DOCUMENT AND WHICH MAY CONTAIN INFORMATION WHICH IS CONFIDENTIAL. WHICH INCLUDES ANY POTENTIAL VULNERABILITIES AND MALICIOUS CODES WHICH CAN BE USED TO EXPLOIT THE SOFTWARE. THIS MUST BE REFERRED INTERNALLY AND ONLY SHOULD BE MADE AVAILABLE TO THE PUBLIC AFTER ISSUES ARE RESOLVED.

Introduction

EtherAuthority was contracted by Scrub-Finance to perform the Security audit of the Scrub-Finance Protocol smart contracts code. The audit has been performed using manual analysis as well as using automated software tools. This report presents all the findings regarding the audit performed on April 18th, 2022.

The purpose of this audit was to address the following:

- Ensure that all claimed functions exist and function correctly.
- Identify any security vulnerabilities that may be present in the smart contract.

Project Background

The Scrub-Finance Contracts have functions like burn, mint, stake, setTaxTiersRate, setTaxTiersTwapenableAutoCalculateTax, setBurnTax, buyBonds, setOraclesetLockUp, withdraw, claimReward, setScrub, setBearOracle, setEpoch, twap, OpenTrade, exit, claimReward, etc. The Scrub-Finance contract inherits the SafeMath, ERC20Burnable, Math, SafeERC20, Address, IERC20, Ownable standard smart contracts from the OpenZeppelin library. These OpenZeppelin contracts are considered community-audited and time-tested, and hence are not part of the audit scope.

Audit scope

Name	Code Review and Security Analysis Report for Scrub-Finance Protocol Smart Contracts
Platform	Cronos / Solidity
File 1	BBond.sol
File 1 MD5 Hash	F9FFE0D5221DD35ECA5F77EAB915AF98
File 2	Bear.sol
File 2 MD5 Hash	AE82BF4B25B372858EBE7A5EEFA089B7
File 3	BearScrub.sol
File 3 MD5 Hash	E60D0930A85D33D2B430C1A248A4874E

Claimed Smart Contract Features

Claimed Feature Detail	Our Observation
File 1 BBond.sol <ul style="list-style-type: none"> Name: Bear Bonds Symbol: BBOND Decimals: 18 	YES, This is valid.
File 2 Bear.sol <ul style="list-style-type: none"> Name: BEAR Symbol: BEAR Decimals: 18 Initial distribution for the MMF launchpad: 0.4 Million BEAR Get Tax Tiers Rates Count: 14 Get Tax Tiers Twaps Count: 14 Burn Threshold: 1,100 Total Supply: 400,001 BEAR 	YES, This is valid.
File 3 BearScrub.sol <ul style="list-style-type: none"> Withdraw Lockup Epochs: 6 epochs Reward Lockup Epochs: 3 epochs 	YES, This is valid.
File 4 BearTreasury.sol <ul style="list-style-type: none"> Maximum Supply Expansion: 4% Bond supply for depletion floor: 100% At least 35% of expansion is reserved for scrub. Maximum Supply for contraction: 35% Premium Threshold: 110 Premium Percentage: 70% Period: 8 hours 	<p>YES, This is valid.</p> <p>Owner authorized wallet can set some percentage value and we suggest handling the private key of that wallet securely.</p>
File 5 LionOracle.sol <ul style="list-style-type: none"> LionOracle has functions like: update, consult, twap. 	YES, This is valid.

File 6 RewardManager.sol <ul style="list-style-type: none"> RewardManager has functions like: earned, claimRewards, stake, exit. 	YES, This is valid.
File 7 Tiger.sol <ul style="list-style-type: none"> Name: Tiger Symbol: TIGER Decimals: 18 Initial distribution for the MMF launchpad: 0.4 Million TIGER Get Tax Tiers Rates Count: 14 Get Tax Tiers Twaps Count: 14 Burn Threshold: 1,100 Total Supply: 400,001 TIGER 	YES, This is valid.
File 8 UserVault.sol <ul style="list-style-type: none"> UserVault has functions like: withdrawAll, stake, withdraw, claimReward, exit. 	YES, This is valid.
File 9 SaleBatch.sol <ul style="list-style-type: none"> SaleBatch has functions like: togglePaused, configureVotingToken, setRaisingAmount, etc. 	YES, This is valid.
File 10 Zap.sol <ul style="list-style-type: none"> Zap has functions like: zapInToken, estimateZapInToken, zapIn, estimateZapIn, etc. 	YES, This is valid.

Audit Summary

According to the standard audit assessment, Customer's solidity smart contracts are **"Secured"**. Also, these contracts do contain owner control, which does not make them fully decentralized.

We used various tools like Slither, Solhint and Remix IDE. At the same time this finding is based on critical analysis of the manual audit.

All issues found during automated analysis were manually reviewed and applicable vulnerabilities are presented in the Audit overview section. General overview is presented in AS-IS section and all identified issues can be found in the Audit overview section.

We found 0 critical, 0 high, 0 medium and 4 low and some very low level issues.

Investors Advice: Technical audit of the smart contract does not guarantee the ethical nature of the project. Any owner controlled functions should be executed by the owner with responsibility. All investors/users are advised to do their due diligence before investing in the project.

Technical Quick Stats

Main Category	Subcategory	Result
Contract Programming	Solidity version not specified	Passed
	Solidity version too old	Passed
	Integer overflow/underflow	Passed
	Function input parameters lack of check	Moderated
	Function input parameters check bypass	Passed
	Function access control lacks management	Passed
	Critical operation lacks event log	Moderated
	Human/contract checks bypass	Passed
	Random number generation/use vulnerability	N/A
	Fallback function misuse	Passed
	Race condition	Passed
	Logical vulnerability	Passed
	Features claimed	Passed
	Other programming issues	Moderated
Code Specification	Function visibility not explicitly declared	Passed
	Var. storage location not explicitly declared	Passed
	Use keywords/functions to be deprecated	Passed
	Unused code	Passed
Gas Optimization	"Out of Gas" Issue	Passed
	High consumption 'for/while' loop	Moderated
	High consumption 'storage' storage	Passed
	Assert() misuse	Passed
Business Risk	The maximum limit for mintage not set	Moderated
	"Short Address" Attack	Passed
	"Double Spend" Attack	Passed

Overall Audit Result: PASSED

Code Quality

This audit scope has 10 smart contract files. Smart contracts contain Libraries, Smart contracts, inherits and Interfaces. This is a compact and well written smart contract.

The libraries in the Scrub-Finance Protocol are part of its logical algorithm. A library is a different type of smart contract that contains reusable code. Once deployed on the blockchain (only once), it is assigned a specific address and its properties / methods can be reused many times by other contracts in the Scrub-Finance Protocol.

The Scrub-Finance team has not provided unit test scripts, which would have helped to determine the integrity of the code in an automated way.

Code parts are **not** well commented on smart contracts.

Documentation

We were given a Scrub-Finance Protocol smart contract code in the form of a file. The hash of that code is mentioned above in the table.

As mentioned above, code parts are **not well** commented. So it is not easy to quickly understand the programming flow as well as complex code logic. Comments are very helpful in understanding the overall architecture of the protocol.

Use of Dependencies

As per our observation, the libraries are used in this smart contracts infrastructure that are based on well known industry standard open source projects.

Apart from libraries, its functions are used in external smart contract calls.

Severity Definitions

Risk Level	Description
Critical	Critical vulnerabilities are usually straightforward to exploit and can lead to token loss etc.
High	High-level vulnerabilities are difficult to exploit; however, they also have significant impact on smart contract execution, e.g. public access to crucial
Medium	Medium-level vulnerabilities are important to fix; however, they can't lead to tokens lose
Low	Low-level vulnerabilities are mostly related to outdated, unused etc. code snippets, that can't have significant impact on execution
Lowest / Code Style / Best Practice	Lowest-level vulnerabilities, code style violations and info statements can't affect smart contract execution and can be ignored.

Audit Findings

Critical Severity

No Critical severity vulnerabilities were found.

High Severity

No High severity vulnerabilities were found.

Medium

No Medium severity vulnerabilities were found.

Low

(1) Function input parameters lack of check:

Variable validation is not performed in below functions:

Bear.sol

- governanceRecoverUnsupported = to

BearScrub.sol

- setOperator = _operator
- governanceRecoverUnsupported = to

Tiger.sol

- governanceRecoverUnsupported = to

Zap.sol

- zapIn = _to , routerAddr , _recipient
- zapAcross = _from , _toRouter , _recipient
- zapOut = _from , routerAddr , _recipient
- zapOutToken = _from , _to, routerAddr , _recipient
- swapToken = _from , _to , routerAddr, _recipient
- swapToNative = _from , routerAddr , _recipient
- settee

```
function setFee(address addr, uint16 rate, uint16 min) external onlyOwner {  
    require(rate >= 25, "FEE TOO HIGH; MAX FEE = 48");  
    FEE_TO_ADDR = addr;  
    MIN_RATE = rate;  
    MIN_APT = min;  
    wait FeeChange(addr, rate, min);  
}
```

○

- In the setFee function, the required condition and error message are conflicting. Error message says "FEE TOO HIGH; MAX FEE = 4%" and condition rate must be ≥ 25 .

Resolution: We advise using validation like integer type variables should be > 0 and address type variables should not be address(0). Fees must have a maximum limit.

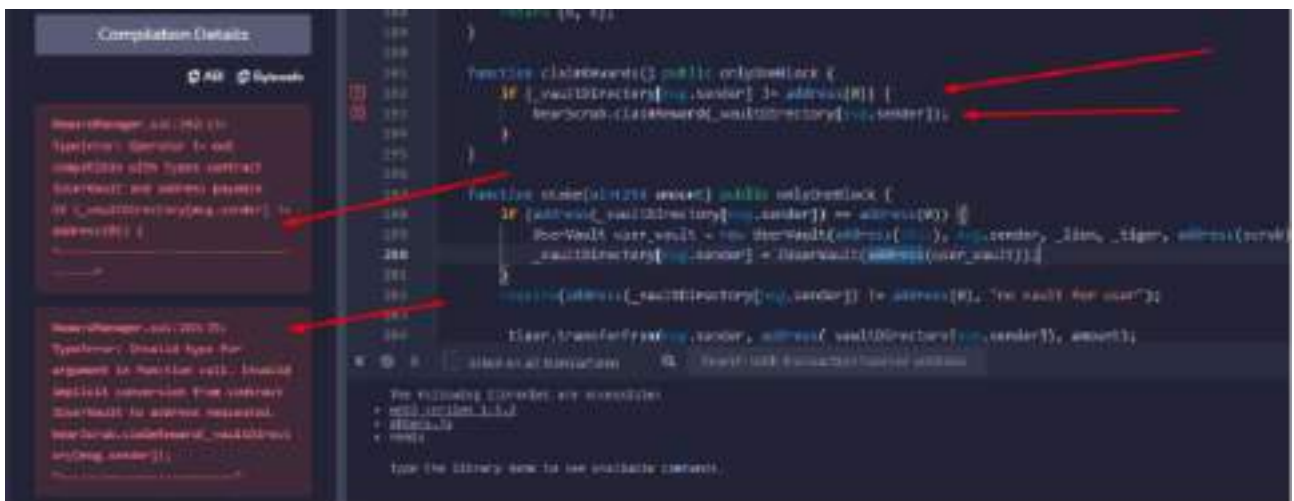

(2) Infinite loop possibility: [BearTreasury.sol](#)

In below functions ,for loops do not have excludedFromTotalSupply length limit , which costs more gas:

- getBearCirculatingSupply
- excludeFromTotalSupply

Resolution: Upper limit should have a certain limit in for loops.

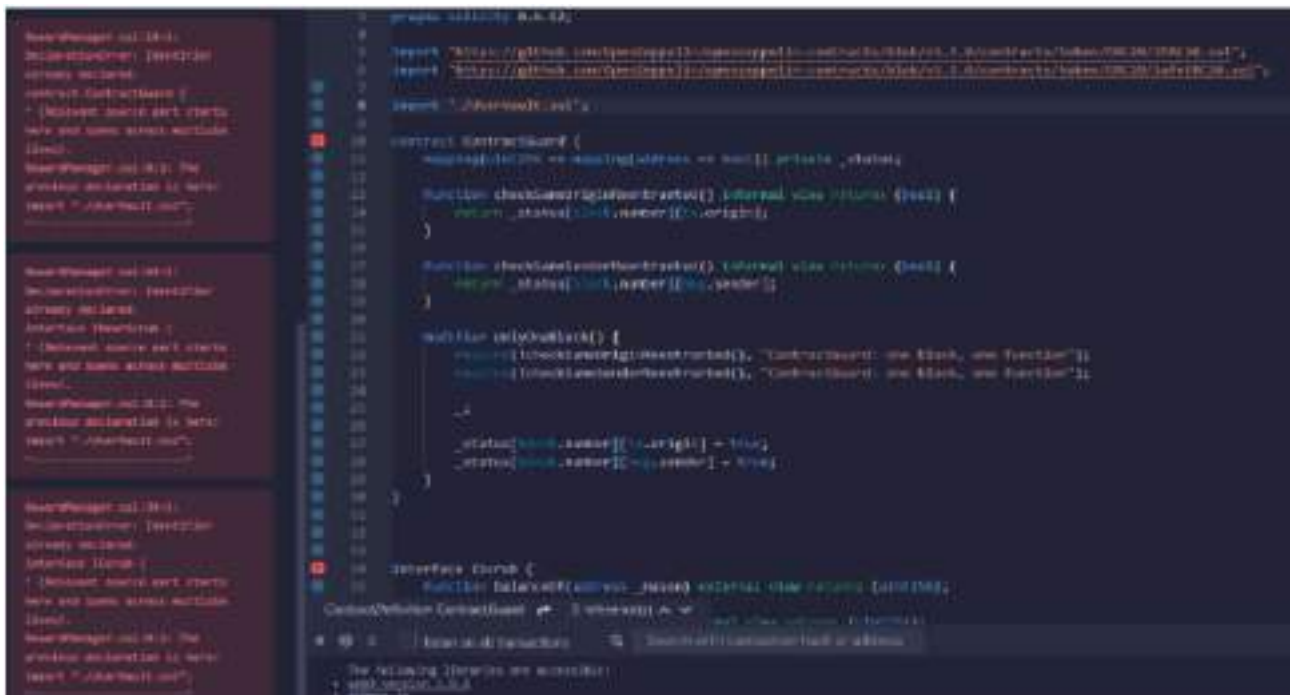

(3) Compile error: [RewardManager.sol](#)

Operator != not compatible with types contract IUserVault and address payable.

Resolution: We suggest replacing `_vaultDirectory[msg.sender]` with `address(_vaultDirectory[msg.sender])`.

Status: Fixed

DeclarationError: Identifier already declared. UserVault also has the same Files imported as RewardManager.

Resolution: We suggest not to import the UserVault.sol file. Instead add UserVault contract code to RewardManager.sol.

(4) Critical operation lacks event log: [SaleBatch.sol](#)
Missing event log for : finalize.

Resolution: Write an event log for listed events.

Very Low / Informational / Best practices:

(1) Unlimited mint: [Bbond.sol](#), [Bear.sol](#), [Tiger.sol](#)
Operators can mint unlimited tokens.

Resolution: We suggest putting a mint limit.

(2) Unused variable: [BearScrub.sol](#)

```
function initialize(  
    IERC20 _bear,  
    IERC20 _share,   
    IBearTreasury _treasury  
) public notInitialized {  
    bear = _bear;  
    share = _share;  
    treasury = _treasury;  
}
```

The share variable is not declared and used anywhere in the contract.

Resolution: We suggest removing unused variables.

(3) Immutable variables:

In below variables values are set in initialize() function and will be unchanged.

[BearTreasury.sol](#)

- bearPriceOne , startTime, bear , bbond

[BearScrub.sol](#)

- bear, share, treasury

[SaleBatch.sol](#)

- startTime , endTime , offeringAmount ,offeringToken ,paymentToken ,perUserCap

Resolution: We suggest setting all these variables as immutable.

(4) Same file imported twice: [LionOracle.sol](#)

```
import "../lib/FixedPoint.sol";  
import "../lib/FixedPoint.sol";  
import "../lib/TokenUtils.sol";
```

Multiple imports for the same file "fixedPoint.sol".

Resolution: We suggest making a single import for "FixedPoint.sol".

(5) Owner can drain all tokens:

[Zap.sol](#)

```
function withdraw(address token) external onlyOwner {  
    if (token == address(0)) {  
        payable(owner()).transfer(address(this).balance);  
        return;  
    }  
    IERC20(token).transfer(owner(), IERC20(token).balanceOf(address(this)));  
}
```

[SaleBatch.sol](#)

```
function withdrawToken(address token, uint amount) public onlyOwner {  
    IERC20(token).safeTransfer(msg.sender, amount);  
}
```

The function withdraw() will allow the owner to withdraw all the ERC20 tokens. This would create trust issues in the users.

Resolution: If these are desired features, then please ignore this point.

(6) Can not update router: [Zap.sol](#)

```
function setUseNativeRouter(address router) external onlyOwner {  
    useNativeRouter[router] = true;  
}
```

The owner can update the router that generates liquidity to an address or contract of choice (including the zero address). This contract could be a malicious contract that simply keeps the tokens sent to it and thus drains all the fees. Additionally, this contract could be used to revert sell transactions turning the token into a honeypot.

Resolution: Consider removing this function. If this is not possible, consider using an Owner account that is behind a significantly long time lock so investors can reasonably see this change coming and inspect the new router. Also consider requiring the router address to be non-zero.

Centralization

This smart contract has some functions which can be executed by the Admin (Owner) only. If the admin wallet private key would be compromised, then it would create trouble. Following are Admin functions:

- mint: The BBond Operator can mint an amount from the recipient address.
- burnFrom: The BBond Operator can burn an amount from an account.
- setOracle: The Bear Operator can update oracle addresses.
- setTaxOffice: The Bear Operator can update the tax office address.
- excludeAddress: The Bear Operator can exclude address.
- includeAddress: The Bear Operator can include address.
- OpenTrade: The Bear Operator Or TaxOffice can open trade status true.
- includeToWhitelist: The Bear Operator Or TaxOffice can include address in whitelist.
- excludeFromWhitelist: The Bear Operator Or TaxOffice can exclude address in whitelist.
- mint: The Bear Operator can mint LION to a recipient address.
- burnFrom: The Bear Operator can burn a LION amount from the address.
- governanceRecoverUnsupported: The Bear Operator can governance recover unsupported amounts.
- setRewardManager: BearScrub Operator can update reward manager address.
- setOperator: BearScrub Operator can update Operator address.
- setLockUp: BearScrub Operator can withdraw lockup Epochs and reward lockup Epochs value.
- stake: BearScrub Reward Manager can create a new stake.
- withdraw: BearScrub Reward Manager can withdraw the amount.
- exit: BearScrub Reward Manager can exit from address.
- claimReward: BearScrub Reward Manager can claim reward address.
- allocateSeigniorage: BearScrub Reward Manager can allocate seigniorage amount.
- governanceRecoverUnsupported: BearScrub Reward Manager can governance recover unsupported amounts.
- setOperator: BearTreasury Operator can update operator address.
- setScrub: BearTreasury Operator can update scrub address.

- **setBearOracle:** BearTreasury Operator can update bear oracle address.
- **setBearPriceCeiling:** BearTreasury Operator can update bear price ceiling value.
- **setMaxSupplyExpansionPercents:** BearTreasury Operator can update maximum supply expansion percentage.
- **setSupplyTiersEntry:** BearTreasury Operator can update supply tiers entry.
- **setMaxExpansionTiersEntry:** BearTreasury Operator can update maximum expansion tiers entry.
- **setBondDepletionFloorPercent:** BearTreasury Operator can update bond depletion floor percentage.
- **setMaxSupplyContractionPercent:** BearTreasury Operator can update maximum supply contraction percentage.
- **setMaxDebtRatioPercent:** BearTreasury Operator can update maximum debt ratio percentage.
- **setBootstrap:** BearTreasury Operator can update Bootstrap value.
- **setExtraFunds:** BearTreasury Operator can update extra funds value.
- **setMaxDiscountRate:** BearTreasury Operator can set maximum discount rate.
- **setMaxPremiumRate:** BearTreasury Operator can set maximum premium rate.
- **setDiscountPercent:** BearTreasury Operator can set discount percentage.
- **setPremiumThreshold:** BearTreasury Operator can set premium threshold value.
- **setPremiumPercent:** BearTreasury Operator can set premium percentage.
- **setMintingFactorForPayingDebt:** BearTreasury Operator can set minting factor for paying debt value.
- **excludeFromTotalSupply:** BearTreasury Operator can exclude account from total supply.
- **includeToTotalSupply:** BearTreasury Operator can include index from total supply.
- **governanceRecoverUnsupported:** BearTreasury Operator can governance recover unsupported.
- **mint:** Tiger Operator mints LION to a recipient.
- **burnFrom:** Tiger Operator burn amount from account.
- **governanceRecoverUnsupported:** Tiger Operator can governance recover unsupported.
- **exit:** UserVault manager can exit.
- **claimReward:** UserVault manager can claim reward.
- **withdraw:** UserVault manager can withdraw all amounts.

- stake: UserVault manager can stake amounts.
- setFee: Zap owner can set fees.
- setUseNativeRouter: Zap owner can set user native router address.
- withdraw: Zap owner can withdraw amount.
- setTokenBridgeForRouter: Zap owner can set token bridge router address.
- withdrawToken: SaleBatch owner can withdraw all tokens.
- setRaisingAmount: SaleBatch owner can set raising amount.
- configureVotingToken: SaleBatch owner can configure voting token.

To make the smart contract 100% decentralized, we suggest renouncing ownership in the airdrop smart contract once its function is completed.

Conclusion

We were given a contract code in the form of files. And we have used all possible tests based on given objects as files. We had observed some issues in the smart contracts, but they were resolved in the revised smart contract code. **So, the smart contracts are ready for the mainnet deployment.**

Since possible test cases can be unlimited for such smart contracts protocol, we provide no such guarantee of future outcomes. We have used all the latest static tools and manual observations to cover maximum possible test cases to scan everything.

Smart contracts within the scope were manually reviewed and analyzed with static analysis tools. Smart Contract's high-level description of functionality was presented in the As-is overview section of the report.

Audit report contains all found security vulnerabilities and other issues in the reviewed code.

Security state of the reviewed contract, based on standard audit procedure scope, is **“Secured”**.

Our Methodology

We like to work with a transparent process and make our reviews a collaborative effort. The goals of our security audits are to improve the quality of systems we review and aim for sufficient remediation to help protect users. The following is the methodology we use in our security audit process.

Manual Code Review:

In manually reviewing all of the code, we look for any potential issues with code logic, error handling, protocol and header parsing, cryptographic errors, and random number generators. We also watch for areas where more defensive programming could reduce the risk of future mistakes and speed up future audits. Although our primary focus is on the in-scope code, we examine dependency code and behavior when it is relevant to a particular line of investigation.

Vulnerability Analysis:

Our audit techniques included manual code analysis, user interface interaction, and whitebox penetration testing. We look at the project's web site to get a high level understanding of what functionality the software under review provides. We then meet with the developers to gain an appreciation of their vision of the software. We install and use the relevant software, exploring the user interactions and roles. While we do this, we brainstorm threat models and attack surfaces. We read design documentation, review other audit results, search for similar projects, examine source code dependencies, skim open issue tickets, and generally investigate details other than the implementation.

Documenting Results:

We follow a conservative, transparent process for analyzing potential security vulnerabilities and seeing them through successful remediation. Whenever a potential issue is discovered, we immediately create an Issue entry for it in this document, even though we have not yet verified the feasibility and impact of the issue. This process is conservative because we document our suspicions early even if they are later shown to not represent exploitable vulnerabilities. We generally follow a process of first documenting the suspicion with unresolved questions, then confirming the issue through code analysis, live experimentation, or automated tests. Code analysis is the most tentative, and we strive to provide test code, log captures, or screenshots demonstrating our confirmation. After this we analyze the feasibility of an attack in a live system.

Suggested Solutions:

We search for immediate mitigations that live deployments can take, and finally we suggest the requirements for remediation engineering for future releases. The mitigation and remediation recommendations should be scrutinized by the developers and deployment engineers, and successful mitigation and remediation is an ongoing collaborative process after we deliver our report, and before the details are made public.

Disclaimers

EtherAuthority.io Disclaimer

EtherAuthority team has analyzed this smart contract in accordance with the best industry practices at the date of this report, in relation to: cybersecurity vulnerabilities and issues in smart contract source code, the details of which are disclosed in this report, (Source Code); the Source Code compilation, deployment and functionality (performing the intended functions).

Due to the fact that the total number of test cases are unlimited, the audit makes no statements or warranties on security of the code. It also cannot be considered as a sufficient assessment regarding the utility and safety of the code, bugfree status or any other statements of the contract. While we have done our best in conducting the analysis and producing this report, it is important to note that you should not rely on this report only. We also suggest conducting a bug bounty program to confirm the high level of security of this smart contract.

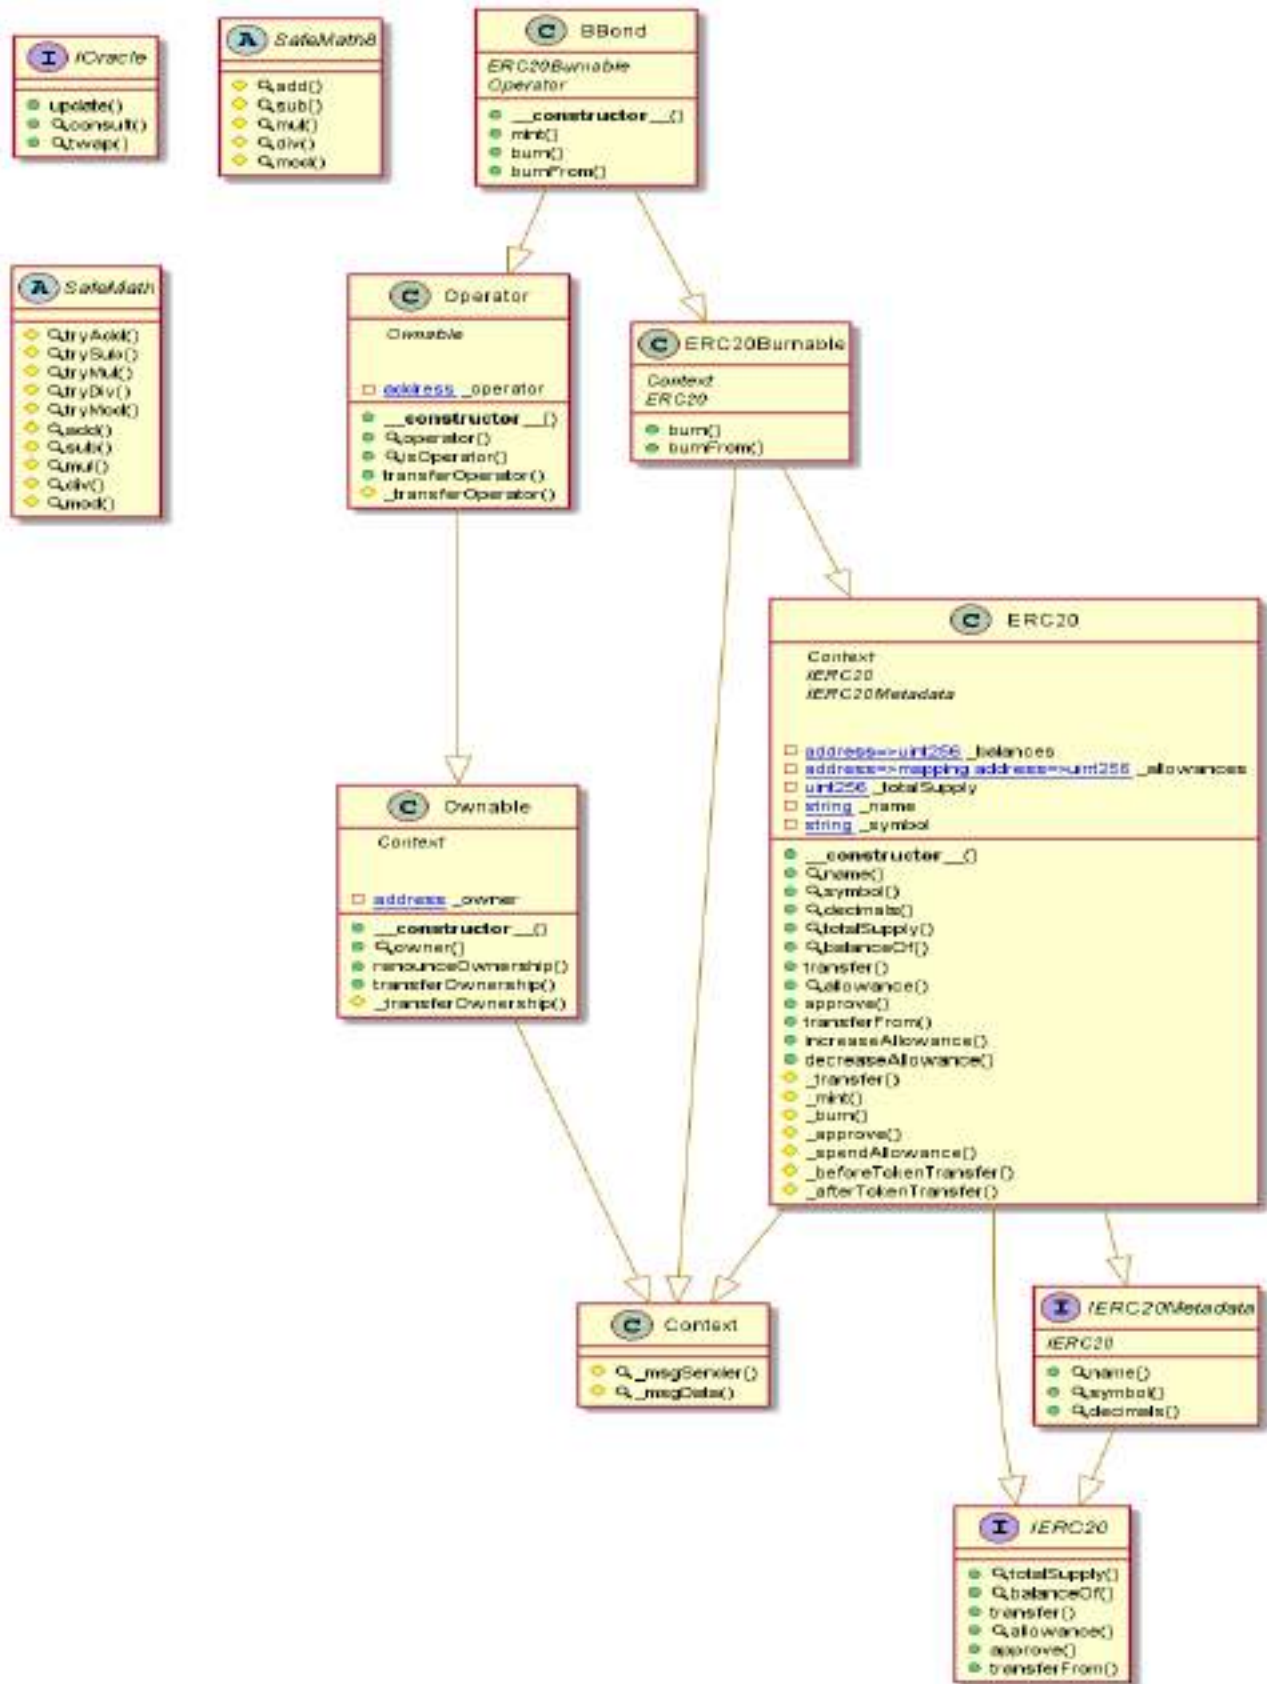

Technical Disclaimer

Smart contracts are deployed and executed on the blockchain platform. The platform, its programming language, and other software related to the smart contract can have their own vulnerabilities that can lead to hacks. Thus, the audit can't guarantee explicit security of the audited smart contracts.

Solidity Static Analysis

BBond.sol

Gas & Economy

Gas costs:

Gas requirement of function `BBond.transferOwnership` is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage)

Pos: 510:4:

Gas costs:

Gas requirement of function `BBond.burnFrom` is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage)

Pos: 960:4:

Miscellaneous

Constant/View/Pure functions:

`SafeMath8.sub(uint8,uint8)` : Is constant but potentially should not be. Note: Modifiers are currently not considered by this static analysis.

[more](#)

Pos: 39:4:

Constant/View/Pure functions:

`BBond.burnFrom(address,uint256)` : Potentially should be constant/view/pure but is not. Note: Modifiers are currently not considered by this static analysis.

[more](#)

Pos: 960:4:

Similar variable names:

`BBond.burnFrom(address,uint256)` : Variables have very similar names "account" and "amount". Note: Modifiers are currently not considered by this static analysis.

Pos: 961:32:

Guard conditions:

Use "assert(x)" if you never ever want x to be false, not in any circumstance (apart from a bug in your code). Use "require(x)" if x can be false, due to e.g. invalid input or a failing external component.

[more](#)

Pos: 861:12:

Data truncated:

Division of integer values yields an integer value again. That means e.g. $10 / 100 = 0$ instead of 0.1 since the result is an integer again. This does not hold for division of (only) literal values since those yield rational constants.

Pos: 427:19:

Bear.sol

Gas & Economy

Gas costs:

Gas requirement of function `Bear.transferOwnership` is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage)

Pos: 511:4:

Gas costs:

Gas requirement of function `Bear.transferFrom` is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage)

Pos: 1144:4:

Gas costs:

Gas requirement of function `ERC20.transferFrom` is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage)

Pos: 1144:4:

Miscellaneous

Constant/View/Pure functions:

`SafeMath8.sub(uint8,uint8)` : Is constant but potentially should not be. Note: Modifiers are currently not considered by this static analysis.

[more](#)

Pos: 40:4:

Constant/View/Pure functions:

`Bear.burnFrom(address,uint256)` : Potentially should be constant/view/pure but is not. Note: Modifiers are currently not considered by this static analysis.

[more](#)

Pos: 1140:4:

Similar variable names:

Bear.burnFrom(address,uint256) : Variables have very similar names "account" and "amount". Note: Modifiers are currently not considered by this static analysis.

Pos: 1141:32:

No return:

Bear.setBurnThreshold(uint256): Defines a return type but never explicitly returns a value.

Pos: 1035:4:

Guard conditions:

Use "assert(x)" if you never ever want x to be false, not in any circumstance (apart from a bug in your code). Use "require(x)" if x can be false, due to e.g. invalid input or a failing external component.

[more](#)

Pos: 1084:8:

BearScrub.sol

Security

Transaction origin:

Use of tx.origin: "tx.origin" is useful only in very exceptional cases. If you use it for authentication, you usually want to replace it by "msg.sender", because otherwise any contract you call can act on your behalf.

[more](#)

Pos: 655:37:

Check-effects-interaction:

Potential violation of Checks-Effects-Interaction pattern in BearScrub.stake(address,uint256): Could potentially lead to re-entrancy vulnerability. Note: Modifiers are currently not considered by this static analysis.

[more](#)

Pos: 841:4:

Gas & Economy

Gas costs:

Gas requirement of function BearScrub.stake is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage)

Pos: 634:4:

Gas costs:

Gas requirement of function `BearScrub.canWithdraw` is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage)
Pos: 806:4:

Gas costs:

Gas requirement of function `BearScrub.allocateSeigniorage` is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage)
Pos: 871:4:

Miscellaneous

Constant/View/Pure functions:

`Address.functionStaticCall(address,bytes)` : Is constant but potentially should not be. Note: Modifiers are currently not considered by this static analysis.

Gas & Economy

Gas costs:

Gas requirement of function Operator.transferOwnership is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage)

Pos: 734:4:

Gas costs:

Gas requirement of function BearTreasury.excludeFromTotalSupply is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage)

Pos: 1316:4:

For loop over dynamic array:

Loops that do not have a fixed number of iterations, for example, loops that depend on storage values, have to be used carefully. Due to the block gas limit, transactions can only consume a certain amount of gas. The number of iterations in a loop can grow beyond the block gas limit which can cause the complete contract to be stalled at a certain point. Additionally, using unbounded loops incurs in a lot of avoidable gas costs. Carefully test how many items at maximum you can pass to such functions to make it successful.
